Iván Moisés Todelano Toledo

Fullstack Developer · Backend & Distributed Systems

Lima, Peru | ivandev2oo6@gmail.com | +51 927 416 434 | linkedin.com/in/iv4n-dev | github.com/Iv44n | iv4n.dev

PROFESSIONAL SUMMARY

I'm Iván, a software developer specialized in backend and distributed systems. I have experience building APIs, scalable services and event-driven architectures with JavaScript, TypeScript, NestJS, Go and Java.

I've worked with cloud infrastructure on AWS, relational databases, Redis caching and deployments with Docker and Nginx. I also build mobile apps with React Native and Expo and desktop apps with Tauri, and I maintain Arcton, an open-source backend framework for TypeScript.

EXPERIENCE

Software Engineer — Japisale

Feb. 2026 – Present

Miraflores, Lima, Peru

- Built an electronic invoice management platform integrated with SUNAT (SIRE): automatic invoice sync and recovery, line-level accounting assignment and export to the accounting ERP, using NestJS, PostgreSQL (Drizzle) and Redis.
- Built a desktop app with Tauri 2 (Rust) and React that authenticates against SUNAT and downloads invoices (XML, CDR and PDF) with retries and backoff, tested against mock servers and shipped with automatic updates.
- Implemented an OAuth 2.0-based authentication system to centralize access across multiple applications, with API keys and rate limiting for machine-to-machine integrations.
- Built asynchronous processing flows with BullMQ, Redis and NestJS events, including distributed Redis locks for access token management.
- Integrated file generation and streaming services to Amazon S3 using services built in Go.
- Designed and implemented the migration of identifiers to UUIDv7 to prepare the platform for distributed scenarios.
- Built a data platform for a contact center (FastAPI and TanStack): scheduled extraction of daily reports, contact sync, and service-quality evaluation with multi-provider LLMs plus per-agent productivity KPIs.
- Extended the central product API (NestJS, TypeORM) with dashboard filters and per-project saved queries over a datamart.
- Implemented AI automations that resolve low-complexity tickets through GitHub Actions and automated Pull Requests, backed by an internal guide framework that lets AI agents understand the project architecture.

SELECTED PROJECTS

Arcton

TypeScript · Bun · Node.js · OpenAPI · Turborepo

TypeScript backend framework published on npm (@arcton/core): a router with defined precedence, context typed from the route literals, validation with any Standard Schema (Zod, Valibot) and a runtime-decoupled core (Bun or Node.js). Ships with a CLI, scaffolding, OpenAPI and docs.

Liro

Bun · Arcton · Better Auth · Drizzle · PostgreSQL · TanStack Start

Decision automation platform: define a decision once and consume it from any system through an API. Bun backend built on Arcton with organizations and API keys (Better Auth), Drizzle and PostgreSQL, and AI evaluation through swappable providers with fallback.

Gestor de Contraseñas Multi-dispositivo

React Native · Expo · Go · PostgreSQL

Mobile credential manager with a zero-knowledge architecture: passwords are encrypted locally with a master key and the Go backend only syncs and stores encrypted data, keeping information confidential even if the server is compromised.

Sistema de Gestión de Proyectos

React Native · Expo · WatermelonDB · Clerk · RevenueCat

Offline-first mobile app for task management, built with React Native, Expo, WatermelonDB and Expo EAS. Integrates RevenueCat for payments and Clerk for authentication.

Just Time

Spring Boot · Spring Security · PostgreSQL · Next.js · Zustand · TanStack Query

Resource access management with request approval, single-use API keys and dynamic connections to multiple databases at runtime. Spring Boot backend and Next.js frontend.

SKILLS

BACKEND

JavaScript · TypeScript · Node.js · NestJS · Bun · Go · Java · Python · FastAPI · BullMQ · REST APIs · OAuth 2.0 · JWT · Better Auth

DATABASES & CACHE

PostgreSQL · MySQL · Redis · Drizzle ORM · TypeORM

CLOUD & INFRASTRUCTURE

AWS · Amazon S3 · Docker · Nginx · Linux · Cloudflare · GitHub Actions · CI/CD

MOBILE & DESKTOP

React Native · Expo · SQLite · WatermelonDB · Tauri

FRONTEND

React · Next.js · TanStack · Astro · HTML · CSS · Tailwind CSS

ARCHITECTURE & PRINCIPLES

- Clean Architecture / Hexagonal
- Lightweight CQRS: decoupled reads and writes
- Event-driven architecture
- Distributed systems and microservices
- Asynchronous processing and file streaming
- Relational modeling with PostgreSQL
- External API integration with traceability
- Scalability-oriented optimization

AI & MODERN PRACTICES

Multi-provider LLM API integration · Automated LLM evaluation · AI agents in CI with GitHub Actions · Claude Code / Cursor / Codex as development aids · Interest in RAG and autonomous agents.

EDUCATION

Universidad Tecnológica del Perú
